User Scenarios

Scenario 1: Patient Visit Management by Doctor (Operational Stakeholder: Dr. Ema)

User: Dr. Ema, a general physician at the health center.

1. Initiation

- Patient Arben enters Dr. Ema's consultation room after triage.
- Dr. Ema opens the consultation module in QSHMS.

2. Interaction with System

- She reviews Arben's medical history, allergies, and triage vitals.
- During consultation, she records symptoms, makes a diagnosis (hypertension), and prescribes medication.
- The system automatically checks for drug interactions based on Arben's history.

3. Hospital Staff Interaction

- Dr. Ema orders blood tests for Arben; the system notifies the lab technician.
- She schedules a follow-up in 2 weeks; QSHMS sends an SMS reminder to Arben.
- If Arben's blood pressure is critically high, the system flags the case as "Urgent - Nurse Follow-up Required" .

Scenario 2: Patient Registration & Triage (Operational Stakeholder: Receptionist)

User: Fatmira, a receptionist at the health center.

1. Initiation

- A new patient, Genti, walks in without an appointment, complaining of high fever.

2. Interaction with System

- Fatmira opens the Patient Registration module in QSHMS.
- She enters Genti's personal details, symptoms, and emergency contact.
- The system auto-generates a unique QSHMS Patient ID and checks for duplicates.

3. Hospital Staff Interaction

- Fatmira selects "Triage Required" ; the system instantly notifies the triage nurse.
- The nurse measures vital signs (temperature, BP, pulse) and records them directly into QSHMS.
- The system places Genti in the priority queue based on his fever (38.9°C).

Scenario 3: Lab Test Ordering & Results Viewing (Internal Stakeholder: Lab Technician)

User: Ardian, a lab technician.

1. Initiation

- Dr. Ema orders a complete blood count (CBC) and fasting glucose for patient Lulja via QSHMS.

2. Interaction with System

- Ardian sees the pending request in his "Laboratory Requests" dashboard.
- He scans Lulja's QSHMS barcode from her digital profile.
- He performs the tests and enters the results into the system.

3. Hospital Staff Interaction

- QSHMS flags high glucose (180 mg/dL) as abnormal and sends an automatic alert to Dr. Ema.
- Dr. Ema reviews the results remotely and prescribes diet changes and medication.

- Ardian marks the request as "Completed - Reviewed by Clinician" .

Scenario 4: Appointment Booking & Insurance Verification (External Stakeholder: Patient + Insurance Company)

User: Blerina, a patient with private health insurance.

1. Initiation

- Blerina logs into the QSHMS patient portal via her smartphone.

2. Interaction with System

- She selects "Book Appointment" → Dr. Ema→ Wednesday at 9:00 AM.
- The system shows available slots; she chooses one and enters her insurance policy number.
- QSHMS automatically verifies coverage via API with the insurance company's system.

3. Hospital Staff Interaction

- Insurance approval is returned within 10 seconds (20% copay).
- Blerina confirms the booking; QSHMS sends SMS and email confirmation with a calendar link.
- The insurance company receives a real-time pre-authorization request for the visit.

Scenario 5: Executive Dashboard & Compliance Monitoring (Executive Stakeholder: Center Director)

User: Mr. Rei, Director of the Health Center.

1. Initiation

- Mr. Rei logs into the QSHMS Executive Dashboard every Monday morning.

2. Interaction with System

- He views live KPIs:
  - Average patient wait time: 18 minutes (target <30 min)
  - Patient no-show rate: 8%
  - Doctor performance metrics (including Dr. Ema's satisfaction score: 95%)
- He drills down into department-wise performance and staff attendance logs.

3. Hospital Staff Interaction

- Mr. Rei sees that Dr. Ema has 95% patient satisfaction and sends her a recognition note via QSHMS.
- The system flags 3 incomplete security audit logs**;** he assigns the IT administrator to review them.
- He generates a weekly compliance report directly from QSHMS for the Ministry of Health.
